Almond Model

Anna Abelman, Julia Dagum, Jaleise Hall

4/8/2021

Summary:

```
#read in the clim data
#clim <- read_csv(here("clim.csv"))
clim <- read.table("clim.txt", sep=" ", header=T)

source("almond_model.R")
```

```
temperature <- clim %>%
  filter(month == "2") %>%
  group_by(year) %>%
  summarize(
    avg = mean(tmin_c)
  )
```

```
rain <- clim %>%
  filter(month == "1") %>%
  group_by(year) %>%
  summarize(
    sum = sum(precip)
  )

df <- data.frame(temperature, rain) %>%
  select(-year.1)
```

```
almond_model(clim)
```

```

```

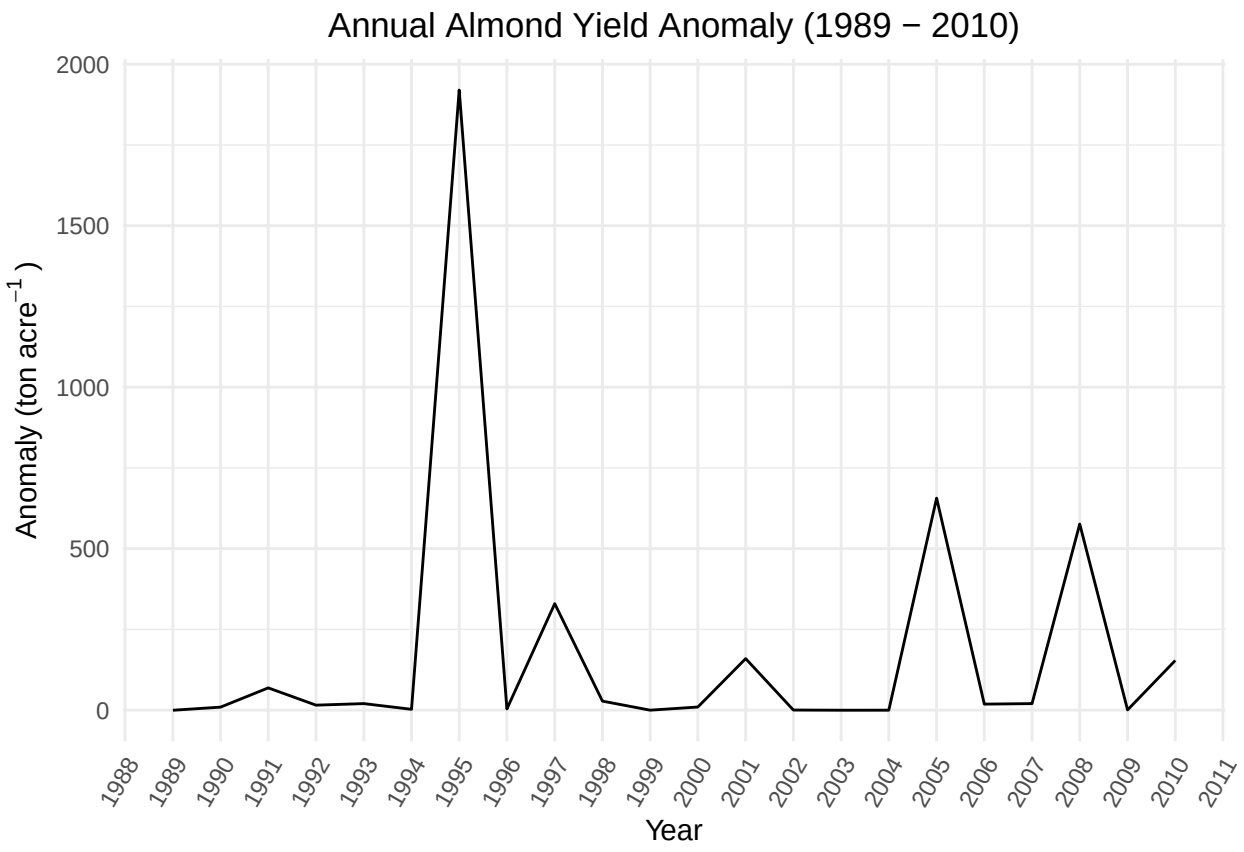

Figure 1: Almond yield anomaly in California for all years 1989 to 2010. The anomaly is calculated using the regression model: $Y = -0.015T_{n,2} - 0.0046T^2_{n,2} - 0.07P_1 + 0.0043P^2_1 + 0.28$
